

**AI-powered technology
delivers the fastest,
most reliable and
status-aware access**

Fewer broken links, happier users

LibKey changes the paradigm from metadata matching to identifier-based linking and automated best-source selection. The result is much more reliable linking, fewer support tickets.

One-click access to PDF and HTML articles

Meet user expectations by replacing too many clicks, confusing menus, and dead ends with simple, fast, and reliable one-click access to millions of articles from hundreds of publishers.

Best Open Access discovery and linking

Multiple data sources are used to determine Open Access availability to provide the best access to OA content, with the option to include (or exclude) non-VoR copies.

Retraction alerting

Publishers, aggregators, and indexes may not adequately indicate when an article has been retracted. LibKey notifies the user at the point of discovery of retraction status to prevent the unwitting incorporation of retracted articles into research.

Unprompted, the Dean of Medical Education said
of LibKey, “Great feature! It is so much easier!”

Chris Duffy, Associate Dean of the Health Sciences Library, Seton Hall University

**IMPROVE ACCESS
FROM ANY POINT OF
DISCOVERY**

LibKey for your discovery service

LibKey seamlessly integrates into all commercial, and open source discovery services, along with custom bento applications.

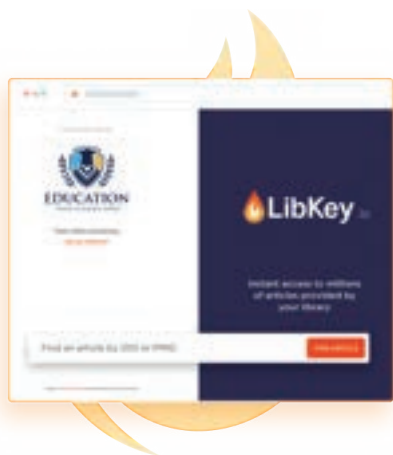

LibKey for your databases

LibKey may be used with any database such as EBSCO, ProQuest, Web of Science, Scopus, Google Scholar, and more – anywhere you use a link resolver today.

LibKey for open web searching

Precision linking from citations discovered at webpages like PubMed, Wikipedia, and publisher pages, to library subscribed and Open Access full text. May be downloaded by individual users or installed automatically across networked computers.

LibKey for DOI and PMID resolution

Single search box enables researchers to go from PMID or DOI to articles provided by their library, not pirate sites, in one-click. LibKey.io is being increasingly adopted by open web discovery, bibliographic management, and systematic review services to link users to their library resources.
